Pick the colour of your phone that best suits your mood—every day of the week—with Tecno's Chameleon Coloring Technology

Wouldn't it be nice if your phone reflected your mood and matched your attire? Like mood lighting, you can set the shade of your smartphone's rear panel using colour-changing technology. Tecno showcased at the MWC. The smartphone's back panel displays colour patterns, and with 1,600 shades at its disposal, you'll surely find one that suits you best. The tech uses a grid of sub-micron prism material that changes direction when an electric field is applied. By precisely controlling the direction of the prism, the material can scatter light at multiple wavelengths, with the colour changing in just 0.03 seconds. Tecno claims the tech doesn't impact power consumption and the patterns can be changed 2 million times.

JUST DO IT (YOURSELF)

While consumers are demanding the right to repair from the world's top smartphone makers, HMD Global—that makes Nokia phones—is designing them such that users can easily repair them. The first one is the G22, and HMD Global has partnered with global repair

Give visits to service centres a miss with the easy-to-repair Nokia G22

company iFixit. Users can access guides on the iFixit website and purchase Fix Kits that contain the tools and parts needed to replace flat batteries, broken screens, bent charging ports and scratched covers. Do note that you should do this only if you love tinkering.
