

ROLL IT AWAY

STANDING TALL

Admit it. You love the ease that comes with an ultra-portable notebook but hate squinting into the somewhat cramped screen. What if you could have the convenience of a small laptop with the luxury of a larger screen? Lenovo's concept ThinkPad gives you just that—a notebook with a 12-inch screen that expands into a 15.3-inch square display with the touch of a button. Using twin motors, the display unrolls vertically and is held taut by attached springs. It's a tad slow though, taking 10 seconds to either roll out or retract. But it could be well worth the wait as the vertically expanded screen helps to increase productivity, especially for tasks such as editing documents or coding. Housing a rollable display, three USB-C ports and a 3.5-mm audio jack, this won't be the slimmest laptop in the market.

VERTICAL LIMIT

Remember those futuristic images of rollable all-screen smartphones? We're not there yet but Motorola did showcase a working prototype of its rollable smartphone. The phone features the classic slider design, where the 6.5-inch screen rolls out at the push

The Motorola Rizr prototype puts a large-screen smartphone comfortably in the smallest of pockets

of a button. You can push the button to retract the flexible OLED panel, which wraps around the bottom edge on to the back panel to act as a secondary display. In the retracted state, the secondary

display can be used to access notifications or as a camera viewfinder to preview shots. The best part? This rollable concept gives you a large screen without compromising on the small form factor, which is a perfect fit for your pocket.
