

LIVING REALITY

AR glasses have been around for a while, and are a boon for the manufacturing and service industries as they superimpose information. But can they replace your regular glasses? Oppo thinks so. With its Air Glass 2 concept, it projects information on a user's view without obstructing their vision. Weighing just 38 gm, this pair is powered by Snapdragon 4100 SoC and has a 200mAh

The Oppo Air Glass 2 concept is a lightweight pair of AR glasses that will pack in a host of features

battery. Most importantly, it has micro-OLED screens with up to 1,000 nits brightness per eye. Serving as a companion to your smartphone, it can be used for calls, viewing navigation routes and reading notifications—without requiring wired connectivity. It will also have the ability to translate between languages and convert voice to text for the hearing impaired.

ALWAYS CONNECTED

Mobile phones may be ubiquitous, but networks are not. For places with no network coverage, it would be nice to have satellite connectivity (a boon during emergencies as well). While only a few smartphones

Motorola's Defy Satellite Link is a satellite hotspot that keeps your smartphone connected all over the world

offer this feature, Motorola's Defy Satellite Link accessory brings it to all smartphones. This satellite hotspot connects to smartphones via Bluetooth and then logs on to Bullitt Satellite Messenger.

Priced at \$99, users will be able to access emergency features such as SOS assistance and sharing one's location, in addition to satellite messaging. But you'll also need a monthly subscription to use this service regularly.

IDENTITY SAFE

Identities are under threat in this connected world, more so when financial transactions are involved. To counter this, home-grown cloud communications platform service provider Route Mobile—which caters to enterprises, OTT players and mobile network operators—

has developed TruSense, a digital identity and security suite. The suite leverages AI/ML for real-time risk assessment, ensuring safe, frictionless authentication without OTP, and facilitating seamless identity verification against authorised third-party data. This will prepare
