

Country Manager, ENGIE India, and COO-Renewables, AMEA; Rahul Walawalkar, President, Sterling, President, New Energy, Reliance Industries Limited; Anish De, Global Head, Energy Planning and Wilson Renewable Energy Ltd

ecosystem that is playing out now in the past three years—you went into the Covid-19 period with a certain knowledge and came out with what's happening—it's very, very different. So, I would not be worried about the very traditional supply chains. I would be more worried about the need to keep the innovation going. The youth of the country is doing fantastic work and they will solve some of those supply chain problem also.

Q: What is your company doing in R&D, in innovations, technology devel-

opments, exploring the trade, and collaborations to have a really integrated renewable energy generation, storage and distribution ecosystem?

RAJNEESH SHROTRIYA, CTO, STERLING AND WILSON RENEWABLE ENERGY LTD: We are regularly mitigating the supply chain challenges to meet the deadlines of the project and its commissioning. Apart from batteries, which is at a very nascent stage at the moment, all the renewable projects will require the support system of BOS (balance of system). And BOS components,

whether it's the transformer, cable or other steel structures, supports or civil engineering. All this is a conversion of raw material of steel, copper, aluminium and cement industries. So, our supply chain should not be under such pressure to convert all this for generating renewable energy and to meet all this demand. The mining must not be done in such a way that will again turn green power into a different perspective. This balance is required. The capabilities are there definitely, we can manufacture, but [only after] keeping all this in mind.

Q: It is one thing to say that we will be achieving our net-zero goals, but we do know that India and businesses here are also price sensitive. When we talk about round-the-clock renewable energy, will it eventually become price sensitive to the grid?
AMIT JAIN, COUNTRY MANAGER, ENGIE INDIA, AND COO-RENEWABLES, AMEA:

What we are seeing globally, for the RE100s (a global initiative of the world's most influential businesses committed to 100 per cent renewable electricity), everybody has some target for 24x7 renewables in the near future. That set apart, price is on one side and different geographies are willing to pay a premium; that's what we are seeing to get that 24x7 target achieved. The merchant market needs to drive this 24x7 story. From the utility or the industry perspective, it is very difficult to say that India will go 24x7 renewables, because it's a developing country and we need base load. And any technology that we have today does not provide that. The drive will come from the merchants' market, the likes of all big tech companies or the RE100s that have some targets for renewables. **BT**
