

stay at home and they were unable to visit any healthcare center for their regular checkups or treatments. The latest technologies introduced in developed countries have trickled down to developing and underdeveloped countries. In earlier times we would only have the option to consult the doctor by visiting them physically in their clinics. Now, with the upgrade to telehealth, patients can consult their doctors digitally. This allows people living in remote areas to consult with and get guidance from the top physicians around the globe.

The major shift from the traditional healthcare systems is seen after the discovery and growing trend of using smartwatches. Smartwatches collect specific data that help doctors track the health of patients by using data management. For example, patients can use digital devices to track their fitness levels, monitor their vital signs, and manage their medication regimens. In recent years, the concept of data-driven healthcare has gained clarity and understanding. It is the concept that can assure that the best treatment algorithms are applied and these algorithms are customized for individual patients.

Some of the innovations observed in the field of healthcare started with the rise of telemedicine, as they

are termed an excellent initiative to fill the gap between patients and physicians. There are many advantages of using telemedicine, such as improved access to medical care, lower costs, and increased convenience. Blockchain secures the data of the patients over a database, which would help protect the data and make it easier for physicians to refer to the data. With its ability to improve security, efficiency, and cost savings, blockchain is poised to revolutionize the healthcare industry.

Cloud computing: Upgrading from the paper filing techniques that were used in the past, now healthcare organizations are using cloud computing to store and share electronic health records (EHRs) to connect with patients and providers through mobile apps, and support clinical decision-making with data analytics.

The benefits derived are there to see as digital technology has made it possible for patients to receive care from anywhere in the world, at any time of day or night. This has greatly increased access to care and made it possible for people to receive the treatment they need more quickly and easily. Overall, the benefits of digitization in healthcare

are numerous and significant.

Digitalization is the future of the healthcare sector. In coming times, due to frequent changes in trends, the healthcare sector will be enhanced. The leaders are the innovators of the revolutions in this sector. This shift will bring out more positive outcomes while dropping the mortality rate. With the inclusion of digital technologies such as virtual reality (VR), wearable medical devices, telehealth, 5G etc. healthcare leaders will continue to improve the treatment of patients.

Some people do believe that the execution of technology is slow but the future of healthcare is looking very promising as there is no disproving. Thus, the healthcare sector is seen adapting and embracing the changes and is more globalized now. These revolutions in the healthcare sector help provide better case detection, advanced and accelerated decision-making, and improved service quality. The healthcare sector is constantly evolving and upgrading to meet the various needs of the patients and providing them with the best possible medical options and care.

DR. GAGANDEEP KANG
(FRS, CMC, VELLORE)

"To realise the dream of becoming an equitable nation in health by 2047, we must reflect on how best to make primary healthcare truly functional, especially when it comes to preventing illness and high out-of-pocket expenses on health"

MR. ADAR POONAWALLA
(CEO, Serum Institute of India)

Dr Cyrus Poonawalla CoE for Infectious Diseases and Pandemic preparedness will offer a variety of services, including public health education and outreach, monitoring and tracking of infectious disease, coordination of response efforts with local healthcare provider, provision of information and support for individual and families affected by epidemic.

DR. MANSUKH MANDAVIYA
(Minister of Health and Family Welfare; Chemicals and Fertilizers, GoI)

"Under the visionary leadership of our Prime Minister, it remains our target to ensure health for all of our citizens. The government has taken several steps towards elimination of kala-azar by 2023. From interventions like pucca houses through Pradhan Mantri Awas Yojana (PMAY), rural electrification, timely testing, treatment, periodic high-level review, to incentivizing through award distribution for states/districts/blocks, government along with its stakeholders are ensuring a robust ecosystem for early detection of the disease and its timely treatment."

DR. C S PRAMESH
Director, Tata Memorial Hospital

A healthy country is a richer country. The utopian standard of universal healthcare — which means that every citizen of the country should be able to access free healthcare — is getting recognised more and more. The World Health Organisation [WHO] has come out strongly in favour of universal healthcare and that is adding to the pressure on governments around the world.

DR. NARESH TREHAN
Chairman-MD, Medanta, The Medicity

"Good medicine will make good business but good business does not make good medicine. So you never lose sight of your core goal, which is to deliver the highest end of healthcare that can be provided anywhere in the world at the most affordable prices."
