

touch and this helped us patients develop trust in our brand & care. This is an important differentiator and the key to our journey. Robust Management & Auditing Systems are in place, along with a centralized control room run by a 30-member team that tracks & monitors around 160 parameters across all the nine Group hospitals, collates and analyses the data and reports their findings directly to me. This helps in synchronous & smooth functioning of all the departments across the group.

What are the key technology trends to be seen in the healthcare industry over the next few years?

We are very passionate about Technology and Kauvery has been in the fore-front when it comes to tech adaptations in healthcare in the country. We believe that efficient processes backed by robust technology which will deliver good clinical outcomes and resulting in patient satisfaction will be the key to any successful Hospital. Evolving

trends like AI - helping in better diagnosis, interesting patient engagement apps, processes efficiency apps helping to lower the treatment cost and essential IoT will be the drivers in the next few years.

How do you see the imprint of Kauvery Hospital in the medical field over the next decade or so?

There has also been a paradigm shift in patient mindset which is 'illness to wellness.' The focus is magnifying towards awareness on preventive healthcare where people are constantly encouraged to undergo routine health check-ups and we can see a rise in the same in the coming years. Master health checkups will be taken more seriously, which will help diagnose health issues much earlier thereby improving the quality of life.

While systems and resources play a vital role in effective functioning, what we cannot miss is the

management of hospital finance which includes avoiding wastage and pilferage. It is essential for a Hospital owner to look beyond balance sheets. Basic understanding and examination of simple accounting procedures like profit and loss accounts, pharmacy and store functions, understanding the key revenue departments and cost cutting by not compromising on quality will ensure smooth functioning. Awareness and understanding the key metrics on a daily basis, will accelerate the growth and aid in decision making.

While these are some changes we have been seeing internally, external factors also play a vital role. For instance, the UHID initiative by government of India which helps bring health records of Indian citizens under one platform is a big technological and digital boon which will completely change the way every hospital will function. Thus, a successful healthcare organization is one which embraces changes, ready to accept new norms and adapt to regulations put forward by the government.
