

TECH CARE

PHARMA FIRMS ARE USING CLOUD TECHNOLOGIES TO DRIVE EFFICIENCIES IN SOME KEY AREAS

1

RESEARCH AND DEVELOPMENT

Pharma manufacturers are using AI and ML to analyse vast troves of data to identify new targets for drug development. Also, Laboratory Information Management Systems (LIMS) such as Thermo Fisher Scientific and LabWare have been deployed to manage laboratory operations, including sample tracking, data management and instruments integration

2

MANUFACTURING AND QUALITY CONTROL

Cloud-enabled automation processes such as enterprise resource planning (ERP) systems including SAP, Oracle and Microsoft Dynamics have improved the speed and accuracy of production lines, along with enabling better quality control measures that ensure products meet regulatory standards

3

SUPPLY CHAIN MANAGEMENT

Through cloud-enabled tech, pharma companies are tracking and managing their supply chains to optimise distribution, reduce waste and improve inventory management

4

SALES AND MARKETING

Pharma companies are using customer relationship management (CRM) systems such as Salesforce and Microsoft Dynamics CRM to manage their customer interactions and sales activities

a beeline for cloud-based tech solutions. For instance, companies like Dr. Reddy's and Pfizer have adopted the AWS platform, while Lupin is using Microsoft's Azure for an array of services ranging from data analytics to generating insights. "The intent of all these [cloud computing services] essentially is to reduce costs in the longer run and innovate rapidly, thus enhancing the route to market for new products," says Mahudawala of Candle Partners.

Pharma firms are using cloud-based solutions for a number of purposes. For instance, Swiss pharma major Novartis has tied up with AWS to build an enterprise-wide data and analytics platform called Insight Centers to provide real-time visibility across its network of manufacturing operations and distribution centres. Similarly, New Delhi-based Mankind Pharma is collaborating with Accenture to improve business agility, performance and operational efficiency. "For pharma companies, cloud platforms and other advanced tech help streamline workloads and reduce costs. Going beyond storage, cloud computing addresses significant privacy, security and compliance issues that the sector faces," says Debashish Roy, Director and Head of Digital Innovation, Customer Experience and External Partnerships at pharma major Pfizer.

But that's not all. With the government's support for domestic biotechnology research and drug discovery, these segments are also seeing renewed focus from pharma majors armed with cloud-based solutions. "AI-enabled drug discovery models can eliminate months and years from the research process, which can reduce the 'time to develop' a drug and accelerate the 'time to treatment' for an individual patient," says Bikram Singh Bedi, MD of Google
