

“The data protection Bill, the telecom Bill, and the digital India Bill will be tabled in the monsoon session. And in the G20 Summit, we will showcase our tech capabilities to the world. Global players are very keen on our growth story”

ASHWINI VAISHNAW

MINISTER OF ELECTRONICS AND
INFORMATION TECHNOLOGY

“The government’s focus on digital infrastructure to power public services and provide last-mile access to healthcare, education, financial- and agri-services speaks of the massive opportunity for collaboration in the tech sector”

REKHA M. MENON

CHAIRPERSON AND SENIOR MANAGING
DIRECTOR, ACCENTURE IN INDIA

“We are doubling down on AI. The notion of being able to capture, curate, and analyse the proliferation of data sets that are becoming real-time, and enabling them to help drive better decisions is vital for the growth of the sector”

SANDIP PATEL

MANAGING DIRECTOR, IBM INDIA/
SOUTH ASIA

are very keen on our growth story,” he added.

Apart from the introduction of new legislations, industry insiders say that the government can help in a few more areas in the times to come. Tuteja of KPMG in India, lists four areas where the government’s contribution can help the IT sector in India. “The first one is a short-term measure, which will be to doubling down on skilling.

The government should make skilling for tech almost free of cost and mandatory in certain streams. The second one is to make the data available and ensure responsible usage. I believe India has a unique advantage of large population-scale data sets. So, having access to data in a responsible manner, not in an irresponsible manner, and making it usable for good research purposes should be the way. I believe the government is working on building policies and mechanisms for data governance, data management, data availability and data transparency,” he says.

Lastly, he stresses on research and innovation to drive the IT sector forward. Classifying innovation as the application of existing technology to new use cases, and R&D as the designing of new core technologies, he says that investments are needed for both of them. “Providing funds for innovation and developing an ecosystem of co-developing innovation through public-private partnerships and academic institutions will go a long way in building sustainable competitive advantage,” he says.

For the Indian IT industry, the next two and a half decades certainly look interesting. **BT**
