

A Road Paved with Ambition

In the next 25 years, India has a wealth of opportunities to become a global leader

IT IS MY belief that the next 25 years in India will be driven by emerging technologies and innovations. The opportunity for us is to look at every industry through the lens of how these technologies will transform them. Consequently, India has the opportunity to become a global leader in technologies and industries.

There is little to doubt that India will cross the \$10-15 trillion-mark in terms of gross domestic product (GDP). We will need to leverage technology to create an economy that is equitable, sustainable, accessible, and inclusive. While we have made impressive gains in per capita income levels, there are still high and worrying levels of disparity. This is where new business creation becomes very important to raise the income levels of more Indians. To nurture entrepreneurship even more successfully, we need to create the right business environment, improve ease of doing business and provide

easy access to risk capital.

We need to ensure that Indians benefit from entrepreneurial wealth creation to create a virtuous cycle that encourages more Indians to invest in new businesses. Entrepreneurs must be responsible to build trust and take up a meaningful role in nation building. This will pave the way for large-scale participation in entrepreneurship and venture investing.

We are in an era where every sector is in the midst of a fundamental change. Electric vehicles and new fuels are shaping the future of transportation. We are witnessing

a huge transition in healthcare and retail. E-commerce is now a part of normal daily life for many Indians. In telecom, the transition to 5G is a momentous development, as much as indigenously manufacturing semiconductors or advanced electrical goods will one day be.

The confidence levels in India are significantly higher as we have managed the Covid-19 pandemic reasonably well. We administered over 2 billion vaccine doses efficiently using technology and at lower costs. When the pandemic struck us, some essential products were not manufactured here. Soon we built local capabilities to make these products and our own confidence levels improved. There is some worry on macroeconomic factors like inflation that has been caused by higher fuel costs and outside forces, led primarily by the Russia-Ukraine war. But these are factors beyond our control and we need to continue to mitigate their impact.

We must focus on fundamentals like investing in R&D. We need to identify strategic and emerging domains. India must not only aim to become a knowledge hub in these domains but also develop our own world-class products. We are making progress in the domains of quantum computing, biosciences, materials science, etc. India is also continuing to create new avenues for digital technology. The transformation in healthcare will be through
