IoT and genomics, where India is making good strides. We will need to pick and choose about 10 different domains that are strategic to India and make a sustained effort to succeed in them. Last but not the least, our technological capabilities have the potential for world-class and low-cost innovation.

I was fortunate to be part of not just a digital computer revolution but also in the creation of a world-class industry in India. With the digital economy at the core of India's development story today, the next 25 years presents a seriously large opportunity to create multiple companies of size and scale. Data is and will

continue to be an important part of the story leading to 2047. To get the best out of it, there are a few things we need to do. A policy framework is required to fully utilise data created by Indians and that must be leveraged for economic development.

For our youth, India is the best place to be in. Where else will one see an economy set to grow six to seven times with a vast majority of the population still coming from the middle class? It makes me very proud to note the achievements of Indian youth. India's new businesses are a creation of this vibrant segment of the population. They easily compare with the best anywhere in the world and we should nurture their capabilities. Our youth need

a long-term approach to build ventures with the right ethics and values. Those who are successful in building successful ventures infused with values are the icons that Indians will look up to.

There is a marked difference in the Indian youth of today compared to earlier generations—they were born into a world of technology like the internet and mobile phone. They are very comfortable with technology and confident of entrepreneurship. This makes me confident about the country's path to leadership in the next 25 years. The road to India@100 is well and truly paved with ambition and hope. **BT**
