

ers lack the knowledge to evaluate the risks associated with DeFi properly. Addressing these challenges is crucial for DeFi to reach its full potential and be embraced by the mainstream.

Which of those problems can Okto solve?

Access to easy and safe self-custody is a non-trivial problem. It is a trilemma of user experience, security, and ownership that must be addressed. Okto aims to solve this trilemma optimally. It ensures no single point of failure, full control on funds with users, and simplifies user experience by eliminating the need for users to handle seed phrases. Okto is an all-in-one Web3 app that offers an intuitive solution that simplifies private key management and eliminates the need for understanding blockchain or private keys.

Additionally, Okto leverages advanced multi-party computation (MPC) technology to provide a keyless infrastructure that ensures the highest level of security and eliminates the need for seed phrases. Okto offers a native experience and curated access to earning opportunities through trading thousands of tokens and depositing idle funds into high-yield generating pools.

Is Okto the most secure wallet?

Okto is a highly secure wallet solution because it utilizes advanced MPC technology. The 2FA-enabled, self-custodial wallet employs cryptography that allows multiple parties to jointly perform transactions while maintaining their individual privacy.

Okto creates a user's private key by dividing it into separate, secret key shares that are stored in multiple locations, unlike centralized exchanges. MPC removes the single point of failure through its distributed key share mechanism while retaining the users as the primary owners of their wallets as only the user can initiate any wallet transaction, offering a very unique self-custody solution. Okto will list only trusted protocols for users and also help users make risk appropriate choices by giving them transparent information about tokens and protocols they are interacting with.

How does Okto help users to discover and trade thousands of tokens?

The Okto app is designed to make DeFi accessible to a wider audience by providing an easy-to-use mobile platform that allows users to access thousands of tokens across various DEXs and discover high-yield generating opportunities without any technical background. The app has a user-friendly interface that mimics Web2 financial apps, but with the added benefits of decentralization. This empowers investors and enthusiasts to take advantage of DeFi

opportunities without needing to have a technical understanding of the underlying protocols.

Okto is an aggregator of DEX aggregators offering the best price among all of them and access to most of the tokens. Users are being offered a selection that is universal.

DeFi has several high-earning opportunities. What are these opportunities that contribute to its growth?

DeFi has opened up a plethora of high-earning opportunities for investors, enabling users to earn passive income through a wide range of protocols and pools, including trading tokens, depositing idle crypto into liquidity pools or farms, and staking. These opportunities offer returns ranging from 15-16% to as high as 70-80% on certain tokens. Additionally, DeFi vaults, which pool funds and automatically reinvest rewards, make yield farming more efficient and profitable, thereby increasing the earning potential for investors. Okto is very agile as it can give access to new & innovative vaults or protocols, which are coming up on a daily basis.

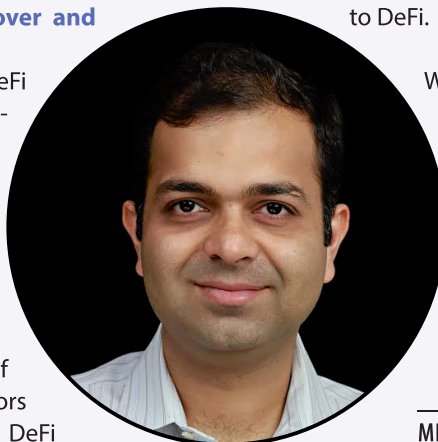

These are the opportunities that brought millions to explore the DeFi ecosystem. In fact, in several ways, DeFi has democratized opportunities that were only available to the sophisticated institutional player. Platforms like Okto now make these opportunities easily accessible and safe for investors by curating and vetting protocols and making them natively available on smartphones.

Can you elaborate on what are the new and emerging areas in DeFi?

The DeFi space is constantly evolving and new areas are emerging as the technology matures. One of the most significant areas of growth in 2023 is the integration of real-world assets onto the blockchain. This will unlock large sums of liquidity and utility, as well as provide opportunities for traditional institutions to inject DeFi liquidity into real-world assets and make them more tradable.

Another key area is security, as users shift their focus to more secure DeFi solutions in the wake of recent high-profile failures. Security is the most important aspect to get masses to DeFi.

Web3 gaming and metaverse are also emerging areas, with the potential to revolutionize the immersive economy and create new social networks powered by social tokens. Additionally, the use of NFTs in the metaverse could also create new opportunities for artists and creators to monetize their brands and have direct interactions with customers without intermediaries.
