

deeper and more meaningful experiences. The biggest growth driver will be in our core knowledge and information [services] such as Search, YouTube and Maps. We are very focussed on computing as a growth driver. In Android, we have our own hardware driver, which is Pixel. The focus is not just phones but beyond that—such as watches, tablets or cars transforming to a digital experience, or what does the connected experience in your home look like. Plus, those are investment areas as well.

The third biggest growth driver is Google Cloud. These are still early days of digital transformation. Google has been a cloud native company from day one. We will continue to invest there. Underneath all that is AI, which will create new opportunities beyond all this over time.

44 | Coming to India, the additional area of excitement comes down to the headroom on digitisation and digital adoption. The question is, how do we scale up to reach more people? That's an example of something that is uniquely Indian. Even when we launched 24 new languages with AI, eight of them were from India—Assamese, Bhojpuri and so on. We take a long-term view on this and a part of the reason why we work with [Reliance] Jio on a more affordable set of phones is simply because India has these aspects—where the journey to reach Indian consumers and help them make that shift to digital with the opportunity it creates makes it so unique and big. I also look at India as a large market where we can do things first and then take it outside or just a “Make in India” model. Google Pay was a big success story and that has laid the foundation for taking it elsewhere. YouTube Shorts is another example where a lot of experimentation was in India and we are now taking it outside [India].

I think bringing Cloud and AI to

the Indian business sector is interesting. In India, certain businesses can leapfrog and build future infrastructure. In areas like cybersecurity, India plays an important role in the connected internet and will be a major player in the global economy.

How do you view the Google story in India so far? Is the best yet to come?

For the past few years, seeing the quality of entrepreneurs in India makes me bullish about what the Indian ecosystem can enable. That was part of the reason why we announced the [\$10-billion Google for] India Digitization Fund and it was a clear belief in the real opportunity that exists. Technology is going to be one of the important growth drivers for any economy and India with its talent base and IT expertise—plus the inherent entrepreneurial risk-taking

trait—makes me very bullish. As Google, we will invest more in India and from India to the rest of the world as well.

Will we see your products being built out of India at some point?

We are at an early stage but having some success. I see that as a trend, which will accelerate over time. Therefore, the short answer is yes.

Google has continuously transformed itself and in many ways, it is a change-maker. How would you like the company's positioning to be?

We have the vision of developing AI responsibly. AI will create a huge opportunity no different from the internet or mobile. To me, AI offers that scale of opportunity. A few years from now, we want not just to
