

DATA TECH LABS: GEARING UP FOR 2050

The future is definitely being shaped by Technology. Artificial Intelligence and Machine Learning is the new normal. As we are in the throes of experiencing our first brush with these developments, TDTL is ready to help Corporates with their expertise and a road map to follow. There's more. They are also working to create an efficient, trained workforce for these companies to ensure a smooth transition in a fast changing world.

Amit Andre has a different perspective. Call it foresight and the willingness to harness the present now to create a prosperous, compelling future. A technology savant, he stays firmly grounded in the present as he crystal-gazed into the future. That alone explains his ability to identify the nascent, yet to evolve demand supply chasm. It is this vision that led to the founding of The Data Tech Labs in 2020. He says, "If we don't start now, we'll be left with people fleeing to work in other nations once again. The future would be vastly different if AI adoption information could be easily accessed."

The development of Artificial Intelligence (AI) technology has been one of the most significant advancements in recent years. AI's need for and effectiveness in helping organizations manage businesses has been a revelation during the pandemic induced interruption. The global lockdown has been a major influencer in speeding up the adoption of this futuristic technology.

Andre launched The DataTech Labs (TDTL) to offer cor-

porates robust expert technology solutions and training with a team of versatile experts who help derive and implement solutions derived from accurate data. He has also extended his expertise to students and educational institutions with e-learning programs.

TDTL cater to varied industry segments like energy, BFSI, healthcare, public sector, retail, transport, telecom and more. Aimed at delivering cloud, on-premise, and hybrid solutions to drive outcomes defined by customers, the versatility and the domain expertise of the team is incredible. Their in-depth technical expertise and well spread out vendor partnerships allows the Lab to deliver technology solutions that support any digital business transformation framework.

Andre explains, "Under digital transformation solutions, TDTL team helps enterprises to derive intelligence from their existing processes and infrastructure to automate processes, reduce costs and improve efficiency. TDTL develops applications using emerging technologies like cloud engineering, data science engineering, mobile

applications on AI or innovative process engineering applications for our customers. We don't recommend that our customers should use a particular application only or change any of their processes. We derive intelligence from the existing infrastructure and give inputs concerning business, data to make it beneficial for customers."

"Understanding the problem of the owner or the operator and then defining and delivering custom solutions is our unique selling proposition (USP). We don't want our customers to unnecessarily stop using what they are using for the last ten years. We ask them their problem statement with the tools or applications they are using. Depending on that problem statement, or what they want to achieve, we provide customized applications and solutions. We have reduced operational costs of manufacturing organizations by 30 to 40 percent by using our applications. Software development, application integration, business intelligence, data science all come into the picture when we design and develop the application," he states.
