

Focus on Per Capita Income

► **MANISH SABHARWAL**
CO-FOUNDER &
VICE CHAIRMAN,
TEAMLEASE SERVICES

INDIA@75 may be ranked fifth in the world in total GDP but is 134th in per capita GDP. My hope for the next 25 years is that we make raising our per capita income our primary policy goal by raising the productivity of five places of which only two are geographic: our states (Karnataka and Uttar Pradesh have the same GDP but a 4x difference in population); our cities (Bengaluru and Patna may have a 50x difference in per capita GDP); our sectors (software is only 0.8 per cent of the labour force but produces 8 per cent of the GDP); our firms (there is a 24x productivity difference between our biggest and smallest manufacturing firms); and our skills (two children of the same age with the same paper qualifications now have a 4x difference in salary based on their soft, functional and industry skills). My vision of India@100 is a new tryst with destiny where our 3Es of employment, employability and education create an infrastructure of opportunity that ensure that the two most important decisions an Indian child does not make today—pin code and parents—become irrelevant to their prospects, prosperity and potential.

REDEFINING THE CONTOURS OF GROWTH

► **S.N. SUBRAHMANYAN**
CEO & MD, LARSEN & TOUBRO

INDIA@100 must attempt to redefine the traditional contours of development. Infrastructure must be sustainable. Skill development must be broad-based, and requirement-driven, technology and IT-enabled services must be human-intensive, automation should eliminate hazards and aid precision, mobility must be non-polluting, and growth must be even. I am confident that we will be able to create sustainable and mass affordable housing, water, and waste management infrastructure. One way to achieve such sustainability would be to utilise hydrogen in hard-to-abate sectors. E-commerce platforms as we know today might be reinvented. Transportation will be end-to-end multi-modal. We have bypassed the normal route of financial inclusion using cellphones and products such as UPI. This must be aided by mega-scale renewable power and clean fuels including nuclear energy. In tangible terms, we should attempt to be at least 30 per cent of global manufacturing and contribute a good 15 per cent of the world's GDP.

INDIA TO LEAD THE WORLD

► **PARTH JINDAL**
MD, JSW CEMENT & JSW PAINTS

INDIA WILL BE A \$12-trillion economy and a healthy middle-income country [by 2047]. The country will use its young demographic, engineering and IT prowess to 'make in India for the world'. It will be a pioneer in the use and advent of green energy—from renewables to green hydrogen. Equally important will be ensuring universal healthcare, education and food for all. While India is on the cusp of a fascinating development story, we must work towards reducing the unacceptably high levels of inequality prevalent today. On the technology front, nothing can come in the way of India taking a dominant position on the global stage. I have no doubt we will be at the forefront of high-quality infrastructure.
