

also signed MoUs with India to take the India Stack back home. “We want everyone to see the capabilities of the India Stack, be it UPI, DigiLocker, Aadhaar, etc. We want to take the India Stack across the world. And it has already started happening; many countries have shown interest in UPI,” says Alkesh Kumar Sharma, Secretary at the Ministry of Electronics and Information Technology (MeitY).

Apart from taking the India Stack global, industry players believe that India’s presidency of the G20 comes at a time when policymakers and regulators around the world are looking for common ground to sketch out regulations for emerging technologies like AI and cryptocurrencies—that have so far defied conventional nation-state boundaries, but whose impact can be disastrous if left unchecked.

It is in this context that Sam Altman, CEO of OpenAI, had told *BT* during his visit to the country earlier this year that India could steer the G20 member countries towards global AI regulations that mitigate the risks associated with generative AI, and still ensure that innovation in the space is not curtailed.

106 | EXPERTS SAY THE task at hand for India is not just to advocate for guard rails around AI that prevent misuse, but also promote regulations that can check the anti-competitive practices of big players, while ensuring that companies big and small have a fair shot at bringing in more innovation in the space.

“What is driving this advancement in AI is essentially twofold. One, the highly powerful GPU chipsets and two, the data that underlies the model,” says Bhaskar Roy, Client Partner for Asia-Pacific at Fractal Analytics, adding that companies don’t have equitable access to data. “For example, if I were to start

my own company today, I have three ways in which I can access new data to actually build a product. First of course are open sources that are available. Second, I can go and buy data from some of these large corporations. Third is to go and do primary research and collect data on my own, which is extremely expensive.”

He suggests that the G20 members should work on building data sandboxes that provide equitable access to data for all. “One way to address this is to establish data-sharing sandboxes where data could be anonymised and made available for the larger public good, so that all the players get a fair shot at new developments in the field of AI,” he explains.

On this, MeitY Secretary Sharma says that India has already been spearheading discussions on AI regulations during the G20 meetings, and also plans to take up the matter at the Global Partnership on Artificial Intelligence (GPAI) Summit 2023 that is to be held later this year, and which is being chaired by India for 2022-23.

While experts agree that advanced chipsets and semiconductors are critical to drive tech innovation,
