

Aadhaar

A unique ID that serves as proof of identity and address for residents of India

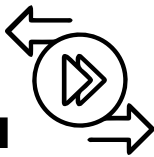

eKYC

Paperless and rapid verification of identity, address, bank details, etc., based on Aadhaar

THE INDIA STACK

India Stack is a combination of open APIs and digital public goods that unlocks identification, data and payments at scale. Some components of the India Stack:

UPI

A digital payments network that facilitates instant, peer-to-peer and interbank transactions

eSign

It allows users to produce legally valid digital signatures on any document

DigiLocker

It allows users to access digital versions of documents like driving licence, vehicle registration certificates, etc.

they say that these technologies are increasingly becoming tools of diplomatic warfare between countries. Neil Shah, VP of Research at market research firm Counterpoint, says: "At this point, semiconductors are crucial not just for technological advancements but also as a means to assert power in global geopolitics. Everyone wants the most advanced fabs and chips because it would give their country an edge on the technology front. And they are being used by existing leaders to assert dominance. An example is the US sanction on export of NVIDIA chips to China".

Industry insiders say that politics aside, such machinations could be detrimental to overall technological advancements. They highlight the impact forums such as G20 can have in ensuring that supply of such products and services do not suffer in the long run. "All leading countries and economies need to sit together to understand whether these (semiconductors) should be monopolised by certain countries, either by way of producing it, or even by way of sanctions that are being imposed, or should there be equal access," says Roy.

Counterpoint's Shah notes that despite the heightened need for an open dialogue, something along those lines is unlikely to happen during the upcoming summit due to the underlying geopolitics between member countries. "I doubt any big announcements would explicitly be made, especially because of China's presence," explains Shah. "But certainly, closed door, one-on-one meetings to discuss semiconductors are most likely to happen."

Despite his reservations, Shah says that all the G20 members and other countries stand to benefit if they collaborate on semiconductor use-cases. "G20 is also an opportunity to draw collaborative deals that bring down the costs of certain technologies. For instance, in the telecom sector, with the development of every 'G' (generation of telecom service), billions of dollars have to be pumped in to build the infrastructure to support it," he says, highlighting the example of the 5G roll-out that saw billions of dollars being invested just to build the infrastructure. "But shared efforts towards advancing Random Access Networks (in which
