“Semiconductors are crucial not just for technological advancements but also as a means to assert power. They are being used by existing leaders to assert dominance. An example is the US sanction on export of NVIDIA chips to China”

“A uniform [crypto] regulation, at least across G20 members, would ensure that market participants do not evade regulations by moving to a different country. And it is important to ensure that retail investors are protected”

each device has an equal privilege to access the network and transmit data) would significantly cut down the costs, and benefit end users.”

FINANCE MINISTER Nirmala Sitharaman has mentioned during Finance Track meetings that India is spearheading global regulations around crypto assets as the G20 President. Further, in early August, India released a ‘Presidency Note as an input for a Roadmap on Establishing a Global Framework for Crypto Assets’ that aims to minimise consumer and other risks derived from crypto-assets, while respecting jurisdictional contexts.

Kavita Gupta, Founder and Managing Partner of Delta Blockchain Fund and Advisor to the Center for Capital Markets Competitiveness at the U.S. Chamber of Commerce, who was also a panellist at the Startup20 Sikhar Summit held in Gurugram recently, highlighted that the current framework to regulate crypto assets will try its best to prevent regulatory arbitrage. “It is important to regulate cryptocurrencies to safeguard retail investors, and ensure

that the technology is not used by bad actors. Moreover, G20 is a platform where regulations will be framed in a way that prevents regulatory arbitrage. But regulations should be spearheaded in a way that innovation is not curbed; that we don’t lose out on real-world use cases of the underlying technologies.”

She adds that India can also showcase to the world how it has leveraged tech like blockchain and NFT in various use cases. For example, the Maharashtra government has issued over 65,000 tribal caste certificates using a public blockchain in Gadchiroli, while the West Bengal government plans to maintain land records in New Town, Kolkata, by minting their non-fungible tokens (NFT).

Be it AI, crypto, semiconductors, or big tech regulation, India’s G20 presidency marks a turning point in shaping tech policies across the world. Further, by showcasing the India Stack and spearheading collaborations on various other crucial tech policy matters and regulations, India is concretely pushing towards a more inclusive and innovative global digital era. **BT**
