

announcements, etc.—and uses natural language processing to predict future trends and structure an investment thesis, all by itself. Then, there are AI-based algos that are not only wired to stocks but are also linked to other asset classes including art, antiques, commodities and debt, among other alternative avenues, while providing a complete investment solution.

The increasing advent of AI will make many jobs redundant in the stock market. The tribe of jobbers and arbitrageurs has already become extinct. A large number of dealers—broking staff who punched orders in the system based on client orders—and relationship managers have also gone missing as investors are using AI-based apps to do daily trades and even get investment insights. Pure-play robo advisors are making human advisors redundant. Several small-sized investment advisory firms—especially in the hinterland that cater to a small set of clients—have shut shop due to

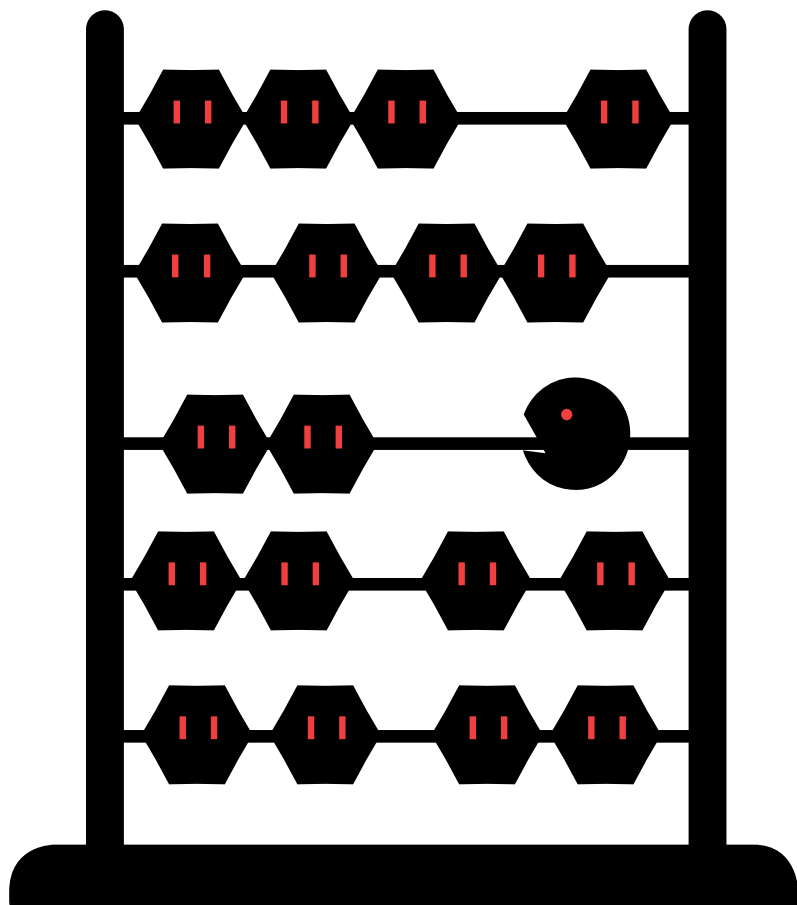

the advent of cheap, even free, digital platforms.

In terms of new roles and skill sets in demand, those with a degree in computer programming or mathematics & statistics or engineering economics would be highly sought after, as they would be able to master the confluence of economics and technology. Incidentally, all leading broking houses now have a full-fledged CTO in place—a post unheard of till a few years ago.

Going ahead, as AI makes further inroads in the stock markets, the reliance on humans will diminish further, especially for plain-vanilla investments. On the other hand, highly skilled humans with specialised skill sets will design smarter machines and codes to help with complex strategies.

Sounds frighteningly logical. Or like V.I.K.I., the highly advanced supercomputer in the movie *I, Robot* says, “... my logic is undeniable”. **BT**

AI HAS HUGE POTENTIAL TO TRANSFORM THE EDUCATION LANDSCAPE, FOR BOTH STUDENTS AND TEACHERS. BUT WILL IT REPLACE THE TEACHER? NOT LIKELY

BY **RACHNA DHANRAJANI**

ILLUSTRATION BY **NILANJAN DAS**

M**Y ASSIGNMENTS NOW** only take about 15 minutes. I enter my topic in ChatGPT, try a couple of commands to make my essays crisp and readable, and that's it. My assignment is done," says Vineeta Roy, a student of Mass Media in a Mumbai college.

According to Harshika Mehta, a teacher at Mumbai University, AI can also help teachers address student needs better. "AI-powered tools like ChatGPT can analyse student data
