

And in terms of client services, Infosys, for example, has built several solutions. Example: an AI solution for intelligent prediction of on-time deliveries, which has helped a logistics company improve its business performance and reduce revenue loss. Another example: a tool to enable hearing-impaired users enjoy existing video content by automatically generating visual captioning, close captioning, and sounds of daily living. “We are leveraging generative AI capabilities to reimagine our services and solve interesting problems for our clients,” says Mohammed Rafee Tarafdar, CTO of Infosys. “As we move into an intelligent era, the emergence of generative AI will provide an opportunity to leapfrog and deliver exponential value to our clients.”

Wipro, with its AI Centre of Excellence (CoE), has enabled National Health Service Scotland to progress towards the institutionalisation and large-scale application of AI, while British outsourcing firm Mitie has gained real-time insights from a system based on the Anomaly Detection solution of Wipro Holmes, its AI platform. “In the ITes sector, AI-based applications can profoundly impact how people and processes work, how businesses engage with each other, and how products or experiences are delivered,” says Subha Tataavarti, CTO of Wipro Limited. “With greater research and innovation, AI can potentially engage more relevantly with the consumer, thus improving end user experiences,”

Persistent Systems’ Kamat says clients are increasingly demanding that the company’s engineers, business analysts, and teams adopt an AI-inclusive approach to their designs. “More and more, our effort is channelled towards how we can deliver on the promise of AI in an enterprise-grade way,” he says. The Pune-based company has built solutions that analyse a plethora of company-specific information including CRM data, different systems of records data, CSAT rating, etc., to help enterprises interact with their own data and get highly contextualised answers while maintaining the privacy, security and sanctity of that data. One such tool, based on generative AI, is being used to analyse large sets of clinical trials data to understand the inclusion and exclusion criteria, and find the most matching patient.

Diverse clients, diverse use cases. For the ITes industry, AI is the future. **BT**

LOGISTICS AS AN INDUSTRY IS RIPE FOR AI-LED DISRUPTION. BUT THE MAN-VERSUS-MACHINE DEBATE MIGHT BE PREMATURE

BY **SOHINI MITTER**

ROM STEAM ENGINES in the 18th century to robotic warehouses and driverless trucks in the 21st, logistics has been a tale of gradual automation. More so now, as the growth of e-commerce propels the industry to an AI-led future. “It’s

hard to imagine successful logistics businesses going into the future without using AI-related capabilities,” says Manish Saigal, MD and Co-leader of Business Transformation Services at Alvarez & Marsal (A&M), which services logistics clients. The use of AI, ML, data and blockchain, Saigal says, will be the single-biggest opportunity in the logistics sector over the next few years. And in India, “it could be a \$10-billion market”.

The driver of the industry’s transformation is e-commerce. The dramatic increase in shipment volumes from the remotest corners of the country is compelling logistics firms to rethink, re-envision, and re-strategise. And many are finding their moat in automation.

Take Shiprocket, for instance. The home-grown logistics unicorn, which enables e-commerce sellers, has built an AI-led Courier Recommendation Engine (CORE) that throws up suggestions to merchant partners on how a product can be delivered at the lowest prices, via the best/fastest routes, and through the best-suited courier partner. “CORE is able to detect signals across geographies, pin codes, courier partners, and customers, and advise sellers on how to
