Apple's MacBook Air has been its most popular model in the notebook line-up. It is light, has sufficient power to handle daily tasks and is much more affordable than the Pro models. But a 13-inch screen wasn't big enough for many. For them, Apple has come up with a 15-inch MacBook Air.

But the additional screen real estate has come at a price—it is thicker and heavier than the 13-inch. Despite the bulkier chassis, the number of ports remains the same: two Thunderbolt 4 USB-C ports, MagSafe 3 charging port, and a

audio and video editing with elan. Despite featuring a fan-less design, the Air does not overheat. What also impresses is the Air's impressive battery life of 15 hours—good enough for your Delhi-New York flight. Plus, the 35W dual USB-C port power adaptor allowed me to charge my iPhone and Air simultaneously.

The 15-inch Air, being bulkier, isn't as portable as its smaller sibling; another pain point is that Apple notebooks start with a capacity of 8GB unified memory and 256GB storage, while 1TB storage has become standard on most Windows systems. The 15-inch Air may not be a ground-breaking device, but it delivers perfectly what many users desired from a MacBook Air: a large, aesthetically pleasing laptop with an affordable price tag. **BT**
