

62 | tual property and copyright, is it misinformation, and then ask yourself whether the current laws we have on the statute books are sufficient or not. And I suspect it will be a mixture of the two; some of the existing laws we have will be able to be applied to AI, and some new laws will be required. I hope that as those new laws develop, they are developed as internationally as possible because this technology is bigger than any country, bigger than any company.

Q: When it comes to international regulation, different countries seem to be proceeding at different speeds. So what you're saying, in principle, sounds correct, but in reality, how do you see that being implemented?

A: I think there is as much a danger in rushing to regulate something that hasn't been properly analysed yet than there is about being too slow. Being too fast could also create problems because it means that you suffocate a lot of the innovation that will come from AI, or that at least will be the risk, which would be a great shame, particularly for countries like India. [For] India, it's not a question of if; it is a question of when India becomes one of the great digital superpowers of the world. It already has the world's second-largest community of developers. And there are fantastic innovators, entrepreneurs and developers in India who are using AI today. And I think that culture of innovation [that] is strong in India... is something you don't want to stymie by rushing to pass laws when

“AI is our best defence against anything we don't want on the platform... I'm quite optimistic that the latest advances in AI will almost help strengthen our defences as much if not more so than help people produce bad content”

it's not always obvious that new laws are necessarily the answer. I do think new laws will be necessary, but I think it's not a bad thing to take a little bit of time to get it right.

Q: A few years ago, Mark Zuckerberg and Facebook had pivoted to Meta. You were drawing out the grand vision of a metaverse, whereas the real revolution seems to have been in artificial intelligence. Were you caught off guard and are you now trying to catch up?

A: Not really, on several counts. First, you can't build the so-called metaverse... without AI, that umbilical link. And that's the reason why far from catching up, we've actually been leaders in AI research for years,
