

we also make research and development (R&D) investments in such a way that some of them produce short-term returns and some produce mid-term returns. And when long-term returns start, it is a step change in terms of the company's growth. We've been making large investments in the specialty business over the past five years, and we are at a position where it will start contributing to the profitability and future growth of the company in a much more meaningful way.

Sun Pharma has recently launched several new products, including specialty drugs. How does the company plan to differentiate itself in these competitive markets, and what are some of the key growth drivers for these products?

In the specialty business, we have a portfolio of several interesting products. Ilumya is a safe and very effective treatment option for patients with psoriasis. If you look at our five-year efficacy and safety data, we have one of the best profiles in terms of efficacy and safety. At the same time, Cequa, a medication for dry eye disease, and Odomzo for patients suffering from basal cell carcinoma (a type of skin cancer) are also effective treatment options. Each of our products addresses an unmet patient need and produces patient benefits, which justifies

the investment that we make in developing novel products.

Sun Pharma has made several mergers and acquisitions (M&As) and strategic partnerships in recent years. Are there any new M&As that you are looking at?

We are currently in the process of integrating Concert Pharmaceuti-

opportunities to enhance our portfolio in ophthalmology.

What are your plans for India?

In India, we have leadership position in terms of share of prescriptions in 12 specialty segments and the idea is to find a way to increase our share of business in these specialties. And find a

we have chosen ophthalmology and dermatology and identified niche products that will help us establish the company with the doctors. As we become more known and established in specialty, it will enhance our ability to introduce more products as well as succeed in getting a greater share of those products when we launch them. We are excited with the response

cals that we've recently acquired in the US. The first priority is to find a way to make a USFDA filing for Deuruxolitinib (used to treat hair loss), at the earliest.

What are the new segments in specialty that you want to explore?

As of today we are not looking at expanding the segments beyond what we already have—that is dermatology, ophthalmology and onco-dermatology. We are continuing to look at opportunities in ophthalmology because we think that we can potentially handle a large portfolio in ophthalmology. We are looking at both companies as well as

way to cumulatively grow our business in such a way that we are able to grow our market share. Last year, we witnessed good growth across multiple therapy areas in the chronic and the sub-chronic segments. Hopefully, we should be able to continue to do that in the future.

Sun Pharma has been focussed on expanding its presence in the US market. Can you discuss the company's strategy for this market, and how it plans to compete with established players and new entrants?

The US market is very large, so rather than trying to compete all over,

we are getting, both for Ilumya as well as other specialty products in dermatology and ophthalmology.

The US generics market has become very difficult to enter with a lot of pricing pressure. How did you sustain robust growth when your peers have faced losses in the US in recent quarters?

I think we got some interesting new product approvals, so that has helped us in growing our US business. But I think your point is correct. It is an extremely competitive market with a lot of pricing pressure, and it continues to create challenges for all players,
