

Netradyne: A visionary telematics system designed to make roads safer for commercial fleet vehicles

India's road infrastructure along with human and environmental casualties make Indian roads prone to accidents. This emphasises the importance of fleet safety and the need to implement telematics in commercial fleet vehicles. Netradyne, an industry leader, harnesses the power of Computer Vision and Edge Computing to revolutionise the modern-day transportation ecosystem.

Avneesh Agrawal
CEO and Founder of Netradyne

In 2019, the number of deaths caused by trucks/lorries was 22,637, which accounted for 14.6% of road accidents in India. In 2018, the country also ranked number 1 among 199 countries in the number of deaths due to road accidents, followed by China and USA. A 2020 report on Statista explored the reasons behind truck accidents and found that

over-speeding was the major cause of road crashes, followed by driver fatigue and sleepiness. Even in countries such as the USA, Europe, and Australia, driver/sales workers and truck drivers had the largest number of fatal occupational injuries.

So how can one leverage the ever-booming industry of technology and automation to enhance driver safety, prevent road mishaps, and build a positive environment for fleet drivers? This is where Netradyne comes into the picture - a leader in the field of telematics that uses Artificial Intelligence (AI) and Edge Computing space. A company founded in 2015 by Avneesh Agrawal and David Julian, to manufacture a multidimensional device - Driveri - in India for the world that pushes the boundaries of intelligent connectivity.

A sophisticated device, Driveri is equipped with HD inward and outward-looking cameras, designed to monitor the driver's activities and the traffic situation simultaneously. The device which is a cloud-connected Intelligent Driver Monitoring System (IDMS) acts as a companion for the driver, triggering alerts when the driver is distracted, drowsy or has violated traffic rules while recording it in real-time and saving it in the cloud for future reference.

With the prevention of untoward accidents being the core value of the company, Netradyne carried out a

pilot study with the Indian Institute of Science and Zoomcar to analyse the effect of voice feedback on driver behaviour and study the efficacy of a device such as Driveri. The test that was conducted on 500 Zoomcars, of which Driveri's voice alerts and outward camera features were activated in 250 test cars, concluded that with the help of Driveri, the number of road accidents was reduced by 14%.

The study is proof that telematics is the need of the hour in the fleet management systems that not only ensure safe driving on road but also create an opportunity for drivers to earn better because of safer driving.

We were in conversation with the co-founder & CEO of Netradyne, Avneesh Agrawal, who gave us an insight into how the company came to be, the assured safety of life and the economy through accident prevention, and what the future looks like for Driveri.

What was the thought process behind setting up Netradyne?

David Julian and I started the company in 2015 to use artificial intelligence and computer vision to improve road and driver safety. The device is mounted on the windshield of the vehicle to monitor the road and the driver simultaneously and has the capacity to not only alert the driver immediately but also record
