

Improved Indoor Air Quality with Panasonic Smart Air Conditioners

By Fumiyasu Fujimori, Managing Director, Panasonic Marketing India

one of the frontrunners in providing this technology in its Air Conditioners. Our ACs can operate in fan mode and do not always require a compressor/ air cooling feature to be turned on ensuring - energy efficiency and round-the-clock indoor safety.

Connected & Convenient

With continuous innovation, Air Conditioners have become smarter with integration of connectivity and sensors. Panasonic's Smart ACs also come with new-age connected technology to further ensure connected living. Panasonic forayed into Connected Living Solutions spaces with the launch of Miraie platform to empower everyday lives of our consumers. Panasonic's Miraie uses new age technologies such as IoT & AI to recognize usage patterns and suggest optimal modes, extending the best comfort for users. For instance, Panasonic's Connected range of ACs i.e., Miraie-enable or, Smart ACs have intelligent and unique features such as the customized sleep mode to enable enhanced flexibility as it allows users to pre-set temperatures profiles through the night for comfort. For example, you can set different temperatures as per your convenience throughout the time that you're asleep, so that you enjoy a comfortable sleep, without having to wake up in the middle of the night to switch off your AC.

The intelligent HU series line-up of nanoe™ X ACs further ensure Comfort through superior cooling via Twin Cool INV (Faster cooling even at 52°C), ECONAVI (Human Activity Sensor, Dual Sensor offers comfort with Energy Savings) and Jetstream technologies (Powerful Cooling, 45 Feet Reach Airflow).

Enhanced durability

Additionally, Panasonic ACs assure durability through Shield-Blu, SuperDyma ODU, and ecoTOUGH technology, which protects the ACs against corrosion from air, water, and other corrosive elements thus, guaranteeing longevity for ACs in all weather conditions, especially in coastal regions. Panasonic smart ACs are also built to endure high voltage surges and operate smoothly throughout a voltage range of 145V-285V.

At Panasonic, we are driven by the vision of creating healthy indoor spaces and environments. The development of nanoe™ X and nanoe™ X is a breakthrough innovation that has set new benchmarks towards this endeavour and allows our customers to live their lives at their best.

We are living in unprecedented times, with the pandemic impacting everyone's health and well-being. Consumer Insights tell us that many people have undertaken home improvement projects, invested in technology with a focus on how to make their homes safe. Further, with rising pollution levels and increased awareness about indoor air quality, consumers have become more conscious about their and their family's health and hygiene. With 'home as the hub' becoming the norm, there is a rising need for better indoor air quality. At Panasonic, we have always believed that wellness begins at home. And keeping that in mind, Panasonic - a leading diversified technology company, with an expertise of over 60 years of manufacturing Air Conditioners, has introduced innovative technologies like nanoe™ and nanoe-G in their products. Panasonic Air Conditioners have been designed for Healthier Homes using innovative technologies to offer - convenience, safety, comfort and durability.

Indoor Air Quality

In the past, for Air Conditioners, people used to consider cooling performance and energy efficiency on the top of their agenda. Now people expect Air Conditioners to not only cool or purify, but also provide safe Indoor Air Quality. And hence our latest range of Air Conditioners (ACs) under the HU series is enabled with nanoe™. With advancements into various proprietary technologies into

air conditioning, for many years, Panasonic has worked towards improving Indoor Air Quality and come up with technology that inhibits bacteria, viruses, allergens, pollens, and moulds that are not visible to the naked eye and are adhered to surfaces and suspended in the air. As a result, Panasonic ACs with nanoe™ X technology are designed to ensure safer and healthier in-room air quality.

nanoe™ X the original ionizer to generate "nano-sized atomized water particles" is a patented technology by Panasonic. It has been successfully tested at Texcell Laboratory, France and proven to inhibit bacteria and viruses. In simple terms, nanoe™ X is an electrostatic atomization technology, that collects invisible moisture in the air and applies high voltage to it to produce "hydroxyl (OH) radicals contained in water". It generates 4.8 trillion hydroxyl radicals in a second that cleanses and deodorizes the indoor air. Panasonic's "hydroxyl radicals contained in water" theory has been researched and developed for more than 20 years.

Similarly, the nanoe™ X technology works on the principle of ionizer technology for the air purification. nanoe™ X charges dust particles with negative electricity and catches them. The air conditioner uses a suction airflow to draw in dust and collect it in an air filter. For as long as the air conditioner is active, the air in the room is being constantly cleaned.

We are extremely proud to state that Panasonic India is
