rations with Microsoft, Adobe, Unlimit, SAP, Cisco, Gaana, TomTom, Nuance and others. Tata Motors, the market leader in India for electric vehicles (EVs), uses Microsoft Azure Intelligent Cloud for advanced navigation, predictive maintenance, remote monitoring features and AI innovation for its connected cars.

In short, in today's automotive market, car companies are no longer merely assembling mechanical parts but developing a complicated computer on wheels. "The next-gen automobile ecosystem will include OEMs, software and service suppliers, systems integrators, device manufacturers, online players and, most importantly, telecom operators," says Nitin Bansal, Ericsson's MD for India and Head of Networks for Southeast Asia, Oceania and India. A report from Ericsson reveals that the connected automobile market is expected to reach \$166 billion globally by 2025. "Glimpses of advancements are already visible in the Indian auto market with the introduction of advanced features such as ADAS (advanced driver assistant system), mobile app-based

controls, etc. The most essential factor to build momentum towards connected cars is fast internet connectivity, which 5G will enable," adds Bansal.

For example, Ericsson collaborated with Audi and sensor manufacturer SICK to connect a German factory with super-fast 5G, so that automated guided vehicles (AGVs) could manoeuvre safely and wirelessly around the workspace, collaborating in perfect harmony with human workers. It also worked with Volvo to conduct a trial utilising 5G connectivity to ensure that maps were constantly updated with the latest real-time information to aid future autonomous driving operations. "Technology will be the critical factor for success of the next-gen automotive industry, and it will also impact shift in the car value," says Bansal.
