

“Companies will stay here only if it makes sense to make in India and ship from India... To be globally competitive there has to be a public-private partnership to build a vertically integrated supply chain that can be resilient for the long term”

A: Yes, we partner with our customers to do it [apply for PLI schemes]. And we’re doing that for cell phones and laptops today. Those are the top two that we’re working on right now.

Q: You are present in many segments, including healthcare and data centre infrastructure. Do you have any plans of expanding beyond the consumer segment in India?

A: The way I like to think about things is, don’t get attracted to the next new shiny bicycle before you make things first. So scaling, just in this space itself, has so much opportunity for us. And like I talked about the infrastructure side, which is our next big focus, whether it’s 5G or things like that, which are important to India. So we really want to focus on going from consumer to infrastructure. And those are the two big areas that we want to scale in right now. For India, I’d say, one more [area] which closely follows is automotive, particularly things like electric vehicles. The medical [area], I think not yet, because we don’t have a big commercial presence in India for medical, and getting the manufacturing setup and support is pretty tedious and pretty long-term. So we want to focus on these sectors first and build scale and presence in the country.

Q: India is trying to position itself as a global manufacturing hub. Do you see this happening?

A: We have to be optimistic. I see India first moving in the direction of being a manufacturing hub to support local domestic consumption, which itself is significant. Just think about the domestic consumption in India and how much is being brought in through imports [and] that itself is a pretty significant manufacturing presence to build. So if India just built self-sufficiency for local consumption, that itself would be pretty significant. That’s a big first step for India to achieve. The second would be to become a global manufacturing hub where you can export to the rest of the world.

Building scale for domestic consumption is a good step in the right direction, because
