

“The first step is building up scale for local manufacturing and domestic consumption, and that is going to lead to making your supply chain more productive, efficient and resilient for global manufacturing”

“Learning new things and... new techniques and making yourself more applicable to technology today are good things, and manufacturing will go through that upscaling in a pretty significant way”

tinue to happen because it has happened in front of my eyes. It's a very different set of skills—which are more technology focussed, which know how to deal with things like bringing up a program to a digital twin that I never imagined 30 years ago. Upskilling of the manufacturing workforce is just an exciting place to be. Learning new things and learning new techniques and making yourself more applicable to technology today are good things, and manufacturing will go through that upscaling in a pretty significant way. But at the end of the day, manufacturing will be all about human beings designing, developing and deploying, and that is not going to change in any way. It is all going to be tied together in a different way and the skills you're going to need are going to be different.

In terms of the availability of labour or what type of labour you need, everybody wants to make manufacturing products closer to that of a home base because the complexity of supply chains has increased significantly. And you can't have local manufacturing and local production without really increasing the number of people available for making that happen. So, manufacturing will continue to be the hot topic for every economy in the world and providing the right kind of labour, whether it is about high technology simulation or for being able to run your complex equipment today, it will still be a significant part of the country's resource strategy. **BT**
