tion schedule exists for the private sector, there is almost no data on the coverage. The IP study—Adolescent Immunization Schedule: Need for a Relook—says that the only disease targeted for prevention among adolescents and adults till recently was tetanus. But with the launch of the measles-rubella campaign, and the proposed substitution of tetanus-toxoid (TT) with Tetanus-diphtheria (low adult dose Td) vaccine, three more diseases—measles, rubella and diphtheria—

have joined the list of VPDs targeted for prevention amongst adolescents. And while the Japanese encephalitis vaccine is also offered to adolescents and adults, it is only in the endemic districts of a few states.

“There is a lack of systematic epidemiological data defining the exact burden of various diseases in the adolescent period. The overall focus of the government is to ensure good coverage rates for the UIP vaccines to infants, and even the booster doses meant for
