

[24]7.ai

360° CUSTOMER SATISFACTION

Consumer Experience is the new normal. Understanding the customer and helping them decide might be a given, but [24]7.ai is taking it to a different level. Their smart technology even comprehends the mood of the consumer to be able to empathize and evolve as an understanding guide.

If you are used to bots and voice help systems, it is time for you to peek into the future.

Unlike most CX vendors, [24]7.ai solutions are based on decades of frontline expertise. Combining advanced natural language capabilities, machine learning, and behavioral data, the company can automate 30-80% of interactions, both simple and complex.

In the realm of Customer Experience or CX, most vendors are either experts at people or technology — but not both. That's where [24]7.ai, a California headquartered global leader in intent-driven customer engagement solutions, is different.

"Our voice and digital chatbots detect sentiment, recognise nuances in written and spoken language, and understand what your customers mean - not just what they say. Smarter automation improves efficiency, reduces handle time, and makes it easier for customers and agents to get things done," states Animesh Jain, Chief Delivery Officer, India and Americas.

The company's deep contact center know-how is embedded into everything it does - from hiring the best talent, to providing ongoing training, to monitoring performance and enabling continual improvement. [24]7.ai takes a Team of Experts (TEX) approach to client relationships and possesses the talent and skills needed to shine.

The [24]7.ai team knows how to put digital channels front and center to deflect calls and lower costs, without sacrificing Customer Satisfaction (CSAT). Leading the industry in messaging services, both automated and agent assisted, the company has infused extensive operational knowledge into the CX solutions to ensure better performance, across the board.

The company's biggest strength lies in its ability to adapt and ingrain technology into its services that are not just tech-enabled but are also tech-enhanced. "We have successfully enabled our people to exercise their utmost efficiency without the fear of burn-out by allotting adequate services to tech automation and letting our employees step in for more complex procedures," says Jain, emphasizing that the company follows a people first policy to promote learning and growth of employees. The organization firmly believes that this philosophy has not just helped [24]7.ai to maintain the best retention rates in the industry but also led to eighty percent of its clients partnering with them.

Established in 2000, the company today serves over 250 enterprise clients spanning 12 key verticals: banking, education, financial services, government, healthcare, insurance, retail, services, technology, telecommunications and cable, travel and hospitality, and utilities.

By putting people at the center of everything, [24]7.ai helps organizations create a personalized and predictive experience across channels. The highly skilled, tech savvy super agents make it easier for customers to get things done across voice and messaging channels, while the industry-leading conversational AI makes it possible to increase containment while also boosting CSAT. By blending AI and agents, the company delivers measurably better outcomes and significant savings.

[24]7.ai has a unique ability to measure not just the cost per interaction but the cost per resolved contact (CPRC) — even for interactions that cross

channels and use both automation and live assistance. This helps you understand what's working, identify areas for improvement and fine-tune customer journey to better control costs.

Developing new strategies [24]7.ai is investing in cloud technologies to make the platform available everywhere. They are also migrating their operational services to the cloud to enable the accessibility. "By taking this step, we are stepping into an evolving phase of information security and compliance-related controls. We are implementing industry-leading practices to make our services reliable, consistent, and safe for our employees and clients. Along with technology & tools, our methods and processes also need to adapt to deliver successfully" says Jain, pointing out that strategic investments are being made to enhance skills and behavior development across the entire organization.

[24]7.ai continues to invest in building technology and solutions that help in understanding customer intent seamlessly transiting between AI platform and human interactions to provide a great consumer experience.

Looking ahead, [24]7.ai firmly believes that within the next two years, the means of communication and interactions with prospective and existing stakeholders are destined to profoundly change the way that businesses and customers interact. If your business hasn't yet deployed an integrated messaging solution, it is time to do so.
