

Smart water management system: Creating waves across industries

Managing a critical resource like water is a major challenge for industries across all sectors and geographies. With depleting ground water levels, unplanned usage, wastage, rising pollution levels and increasing temperatures across the globe, the water crisis is likely to intensify in the next few years.

It is feared that almost half of the world's population could witness water scarcity by as early as 2025. According to the UNICEF, about 4 billion people experience severe water scarcity for at least one month each year. More than 2 billion people live in countries where water supply is inadequate, and some 700 million could be displaced by intense water scarcity by the year 2030.

India is one of the most water-stressed regions of the world, and parts of the country are prone to floods and droughts. Monsoons are often erratic, and local water sources are stretched. For decades, water pollution and encroachments on water bodies, along with depleting ground water levels, have been key concerns in many regions of the country.

In such a scenario, judicious use of water, recycling and managing wastewater are some of the critical issues that industries are actively addressing. In fact, surveys, research and forward-looking sustainable

efforts have become an integral part of day-to-day operations and practices for industries as they look at achieving their climate goals. Some popular and effective sustainable initiatives include utilizing wastewater in pre-treatment systems and using strainers and filters for back wash water, along with dewatering techniques.

When it comes to the Adani Group, responsible use of a critical resource like water forms a key component of operations and management across businesses. The Group exercises prudence in the use and management of water. Several processes have been put in place with the aim of maximising recycling efforts and minimising the dependence on
