

capacity-building programmes, sharing knowledge and expertise, establishing an open-source solutions repository,” explains N.S.N. Murthy, Partner and Government & Public Services Consulting Leader at Deloitte India.

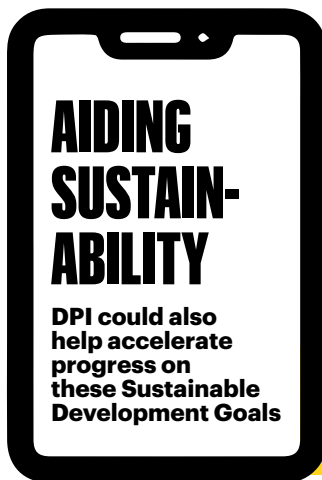

After all, DPI is more than just a tech stack. Strong governance systems and a participatory ecosystem can help DPI deliver economic and social benefits. It can help scale various Sustainable Development Goals (SDGs) as well. Murthy of Deloitte explains that DPI has already played a crucial role in increasing financial inclusion through Aadhaar, electronic Know Your Customer (e-KYC) processes, and payment solutions like UPI. These components enable access to formal financial services, promote savings, and facilitate access to credit, contributing to SDG 1 (No Poverty) and SDG 8 (Decent Work and Economic Growth).

Similarly, open networks across health, education, commerce, and energy sectors are contributing to goals like SDG 4 (Quality Education), SDG 3 (Good Health and Well-being), and SDG 9 (Industry, Innovation, and Infrastructure).

ENDLESS POSSIBILITIES

Though many services have been incorporated into the DPI in India, the government is planning to add 20 to 30 new ones to the stack. “Prime Minister [Narendra Modi’s] vision is that there will be no part of government that will be left without any digital asset. So, effectively, you will see DPI [that] spans the entire spectrum of current government public services and anything that we are planning in the future,” says Chandrasekhar.

The possibilities aren’t confined just to newer digital services. There is also the poten-

SDG 1 NO POVERTY

Solution Services like Aadhaar, UPI and data sharing and models can help tackle poverty. These approaches can improve the economic resilience of marginalised groups, increase access to private and public services, and reduce vulnerability to crises and disasters

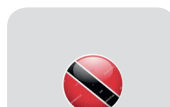

SDG 3 GOOD HEALTH AND WELL-BEING

Solution Public and private players are leveraging DPI for health—such as the sharing of health data (Bahmni or OpenELIS, Brazil’s Open Health, France’s Health Data Hub) and leveraging verifiable IDs and registries (Ayushman Bharat Health Account)—to enhance good health outcomes

These nations now have the opportunity to adopt and utilise the India DPI within their borders

tial of harnessing the power of artificial intelligence (AI). It is a new paradigm that is transforming solutions in the digital world and is likely to play a transformative role in the DPI ecosystem, too. “It forms a natural next step as DPI systems around the world today hold a treasure trove of powerful and standardised data collected at scale. Entrepreneurs have already started leveraging this data for AI solutions,” says Walia of Dalberg.

For instance, providers of financial services use AI on data shared with consent through the Open Credit Enablement Network (OCEN) and account aggregators to evaluate credit-worthiness. Data from France’s Health Data Hub is being used for medical research. There is the potential to unlock
