

BOE 110-INCH 16K DISPLAY

► **How about a** 16K television that you can hang on your wall? While not available commercially yet, Chinese display major BOE recently unveiled such a TV with a screen size of 110 inches, and an insane resolution of 15,360 x 8,640 pixels or 132 million pixels. With a contrast ratio of 1,200:1, this TV delivers sharp pictures and vivid colours. The super sharp screen will certainly make your personal cinema stand out in the crowd, but those who love gaming on the big screen should know that the TV's refresh rate is limited to 60Hz. That said, if BOE launches this product in the market, this will be one of the first 16K TVs you can buy off the shelf. Expect to pay a pretty penny if and when BOE brings it to the market. But for that price, you get your hands on one of the cutting edge display technologies of our times.

SONY 790-INCH 16K CRYSTAL LED

► **Yes, you read** that right—this video display is indeed that big. However, this gigantic screen boasts a remarkable contrast ratio exceeding one million to one, ensuring unparalleled precision in lighting levels, minimal heat emission, and astonishing picture quality. Utilising ultra-fine micro-LEDs—each measuring just 0.003 sq. mm or half the width of human hair—this display unit delivers sharp, distortion-free moving images, and supports high frame rates, and will stand you in good stead whether you're watching a movie, playing a game, or even working on an excel sheet (if you so desire). Priced at an estimated \$5 million, this modular display can be customised as per your needs, but you need this size to watch 16K content in all its glory.
