expect a convergence in these skills as people get together diverse teams to innovate on complex problems like climate change technologies, genetic engineering, autonomous transportation, and so on.” Towards this, the Bengaluru-based firm has started hiring people with diverse backgrounds—liberal arts, experience design and cognitive sciences, among others.

AUTOMOTIVE

The push for electric mobility and connected vehicles along with emerging use cases of technology, electronics & electronics as well as design is transforming the country's automotive industry

into one rife with opportunities.

“A full-fledged self-driving car may take a few years to come to India. So, we have adapted the global concept of ACES (autonomous, connected, electric and shared vehicles) to our market. We call it CESS (connected, electric, shared and safe vehicles),” says Kumar of Tata Motors, which is focussing on both connected vehicles within ICE, as well as EVs. To strengthen the safety performance of commercial vehicles, ADAS (advanced driver-assistance systems) becomes crucial, he adds. It is a set of safety-enhancing technologies for automatic braking, lane change warnings, collision prevention and adaptive cruise control which are powered by AI and ML.
