

TAG

We hate losing luggage in transit. While technically you can't do much but pray that the airline sorts it out, some smart tags can help. If you're an iPhone user, Apple's AirTag is a great buy. Using the Find My app on your iPhone, it shows the tag's exact location on the map, but the range is about 10 metres. However, in 'Lost Mode', one can locate the AirTag with the help of other users on the 'Find My' network. This uses other Apple devices to listen to pings from the AirTag and relay it to the owner about the location, without compromising on privacy.

PROTECT

We might have resumed international travel but we need to keep maintaining Covid-19-appropriate behaviour wherever we go. Carrying along a UV steriliser might be worth the weight. The UV light kills up to 99 per cent of harmful germs and bacteria. Just place your phones, earbuds, wallet and other stuff into the box, close the lid and turn on the power for 10 minutes to disinfect.

Protecting devices from germs is only half the story.

You also need to protect them from surges while being able to use different electrical sockets across the world. A good hack is to carry a universal adaptor and a surge strip to power all your devices. Carry a good-quality surge protector, like this one from Honeywell, using which you will be able to charge four devices simultaneously.
